in singapore during 2015 group b streptococcus gbs sequence type 283 st283 caused the only reported foodborne outbreak of invasive gbs disease over 20 percent of cases were healthy adults without comorbidities which is unusual for gbs the outbreak was linked to the consumption of raw freshwater fish subsequent investigations found that st283 gbs has been common among gbs causing disease in humans and in tilapia across southeast asia for at least 20 years whereas it was almost non existent outside this region given the novelty of the outbreak this risk profile consolidates the current knowledge to identify data gaps about gbs st283 along the freshwater fish supply chain in southeast asia although gbs fish infection can present with few clinical signs of disease outbreaks of gbs in high intensity tilapia aquaculture can result in severe infection with mortalities of up to 80 percent these outbreaks are largely

undocumented but likely have a wide effect on aquaculture given its economic and social importance across southeast asia there is also a lack of data on patterns of fish consumption including frequency amount preparation and consumer demographics nevertheless consumption of non heat treated freshwater fish is common in southeast asia given the multitude of data gaps the risk posed by gbs st283 from consumption of freshwater fish remains highly uncertain potential risk management options start with the application of good aquaculture practices and good food safety measures throughout the supply chain

the period that followed world war ii has witnessed a dramatic change in neurology from being a discipline in which its participants were castigated for being interested solely in diagnosis usually of disorders of unknown causation without effective therapy neurology has evolved into a highly active treatment orientated subject this transition is clearly reflected in the approach to diseases of the peripheral nervous system and to the guillain barre syndrome gbs in particular in a state of the art review made in 1952 elkington 1952 observed that no less than 56 of neuropathies remained undiagnosed and amongst those of unknown causation he listed gbs with intensive investigation and follow up the proportion of neuropathies seen at tertiary referral centres which elude diagnosis is now as little as 13 mcleod et al 1984 overall of course the proportion is even less this change is partly because of the introduction of new diagnostic techniques and partly because of the application of the great expansion in knowledge evident throughout medicine in this book professor richard hughes has assembled current information on gbs and related disorders including chronic inflammatory demyelinating polyneuropathy cidp the existence of which was not appreciated until austin s perspicacious study published in 1958 in the introduction professor hughes gives an account of the way in which recognition of the gbs emerged and matured and shows that it followed pari passu with the realisation that paralysis and sensory loss may result from peripheral nerve disorders

also of the handling and care of any long term intensive care patient and their subsequent rehabilitation for the curious it will answer many questions for g b s patients and their families it should provide inspirational reading the foreword to the book has been written by dr frank warshawski md frcpc director of intensive care rockyview general hospital calgary in addition to that prestigious involvement the author has been fortunate in receiving permission to use other material authored by exceptionally well qualified medical professionals for which due credit is given in the acknowledgements section of the book enabling him to produce not only an interesting publication but an informative and educational one in short a must read and deserving of a place on any medical bookshelf
